

Shate product packaging requirements

A shate is a plate with a dimension of 2x4M, 2x5M, 2x6M, 2x8M, 2x12M

GENERAL REQUIREMENTS

- The pallet must be suitable to be handled by forklift (minimum 8cm space from pallet to floor).
- The pallet must not be longer/wider than the material to allow safe storage.
- Material should be packed strapped with steel/PE band to avoid slipping and allow safe handling.
- There must be 40cm of space between the first wooden foot and the edge of the pallet
- Please consider the positive/negative examples on page two.

COLLI WEIGHT

WITHIN LIMIT

2.000 - 2.500 KG

Good & less good examples

More than four wooden beams were used, the material is properly strapped, covered with a lid and wrapped in foil to protect it against moisture.

Only four wooden feet have been used, resulting in the material bending and the pallet bursting. Most common for smaller material thicknesses (<4mm)
